

Enterprise Transformation Model

In today's global and competitive world, organizations can survive only by continuously reviewing and renewing their ways of doing business. Every organization operates with certain inputs and produces outputs. The main goal is to increase efficiency and profitability by ensuring that the value derived from outputs exceeds the cost of inputs.

The Enterprise Transformation Model aims to increase the value of outputs, reduce losses, and define the proper structure for digital transformation by ensuring that the inputs of the processes in the company receiving consulting services are properly structured.

The Sempro Enterprise Transformation Model consists of four (4) modules.

Initially, the needs of the company wishing to implement the model are assessed. Based on this assessment, the modules can be implemented individually, entirely, or in pairs depending on the consultancy scope.
